Avery Quill

Millbrook, OR | (503) 555-0142 | avery.quill@example.com | linkedin.com/in/avery-quill-sample | github.com/avery-quill-sample

Summary

Backend engineer with seven years of experience building Python services and REST APIs for logistics and retail teams. Comfortable owning a feature from the database schema to the deployment pipeline, and happiest on small teams that write things down.

Skills

Languages: Python, SQL, TypeScript

Frameworks: FastAPI, Django, React

Data: PostgreSQL, Redis, data modeling, query tuning

Infrastructure: Docker, AWS (ECS, RDS, S3), GitHub Actions for CI/CD

Practices: automated testing with pytest, code review, design docs, mentoring

Experience

Senior Software Engineer | Lumen Parcel Co. (fictional) | March 2021 - Present

- Designed and maintained the REST APIs behind a dispatch dashboard used by forty dispatchers across three warehouses, built with FastAPI and PostgreSQL.
- Cut the median response time of the route lookup endpoint from 900 ms to 120 ms by adding a Redis cache and rewriting two queries after reading their plans.
- Introduced design docs for every change larger than a week of work, and reviewed most backend pull requests on a team of six.
- Mentored two junior engineers through their first on-call rotations and their first production database migrations.
- Moved the test suite from a nightly job into GitHub Actions so every pull request runs pytest against a real PostgreSQL container in Docker.
- Led the move of three services from hand-managed servers to AWS ECS, writing the runbook and the rollback plan before the first cutover.

Software Engineer | Copperleaf Outfitters (fictional) | June 2018 - February 2021

- Built order and inventory services in Django for an online outdoor gear shop, handling seasonal peaks of several thousand orders a day.
- Wrote the data model and migrations for a returns workflow that replaced a shared spreadsheet, and documented it for the support team.
- Added automated tests around the checkout path, raising coverage of that module from roughly a third to over ninety percent.
- Worked with the frontend team on a small React and TypeScript admin tool for adjusting stock counts.
- Joined the on-call rotation in my second year and wrote alerts that paged on failed payments rather than on every slow request.

Junior Developer | Riverbend Print Shop (fictional) | July 2017 - May 2018

- Maintained internal Python scripts that turned customer orders into print jobs, and replaced the riskiest of them with a small tested web service.
- Kept the shop's order database backed up and documented, and answered the phone when a print job went wrong, which taught me more about error messages than any course.

Education

B.S. Computer Science | Millbrook State University (fictional) | 2017
